

## ABOUT PSPA

We are the only national charity offering support and information to people living with PSP & CBD. We fund research to help us understand the development of PSP & CBD, improve diagnosis and discover effective treatments. Alongside this, we educate health professionals to make them more aware of these devastating diseases.

Everyone's experience of PSP & CBD is different, and how the condition may affect your day-to-day life can vary.

By providing practical information about PSP & CBD we hope this leaflet will answer some of your questions. It also has information that may be helpful for family members, carers and friends.

## HOW WE CAN HELP

- Our confidential helpline and information service offers practical and emotional support from Monday to Friday. Telephone 0300 0110 122 Email [helpline@pspassociation.org.uk](mailto:helpline@pspassociation.org.uk)
- Our Helpline Care Navigators offer information on symptom control, practical management, improving quality of life and signposting to other organisations. They strive to ensure people have access to good local support and a local keyworker to coordinate their care, wherever possible.
- Our volunteer-led local groups provide the opportunity to meet others and share experiences.
- We publish a wide range of information, including a step by step guide to living with PSP & CBD.
- Our forum Healthunlocked is a safe place for people affected by PSP & CBD to share experiences.

## ABOUT PSP

Progressive Supranuclear Palsy (PSP) is a neurological condition caused by the premature loss of nerve cells in certain parts of the brain.

A protein called tau builds up in certain areas of the brain and forms into clumps (neurofibrillary tangles), which are believed to damage the nerve cells. Over a period of time this can lead to difficulties with balance, movement, vision, speech and swallowing.

There are no simple tests or brain scans for PSP. In its early stages, symptoms can resemble those of other neurological conditions such as Parkinson's disease, Alzheimer's, Stroke or Multiple System Atrophy and misdiagnosis is common.

Each case of PSP is unique and symptoms can be experienced with varying degrees of severity and at different stages of progression. Early symptoms may include loss of balance, falls (often backwards) stiffness and eye problems – this might be difficulty in looking up or down.

PSP is life-limiting and there is no cure. Although the disease will progress, symptoms can be managed to help achieve the best possible quality of life.

## ABOUT CBD

Corticobasal Degeneration (CBD) is a degenerative brain disease affecting people from the age of 40 onwards. Although there are similarities to PSP, with similar nerve cell damage and the build-up of a protein called tau in certain parts of the brain, the classical clinical picture is quite distinct.

However, people diagnosed with CBD may go on to develop features of PSP and vice versa. Overlap between the two conditions is now well recognised.

Cognitive problems are common in CBD and are often one of the first symptoms families notice, particularly apathy, impulsive behaviour, changes in empathy and language. Other signs of CBD may include progressive numbness and loss of use of one hand. There can also be jerking of the fingers, slowness and awkwardness and the feeling of having an 'alien limb' – with complex unintentional movements of one limb causing problems with normal motor tasks.

There are currently no treatments for CBD but there are a number of ways to help manage the symptoms.

As with PSP, there are no simple tests or brain scans for CBD to help neurologists diagnose the condition. CBD is often initially misdiagnosed as a Stroke or Parkinson's disease.
